

The ISO Norm – new developments Additional information on Microchips

PLANET ID®

3rd Workshop I & R, Brussels, 10th of July 2013

Presented by Dr. med. vet. Sven Hüther

Terminology, avoiding misunderstandings

1. Microchip = Silicon = Intelligence
2. Antenna = a) Ferrite core
b) Air coil
3. Surrounding material: here BIOGLASS (class 8625)

The antenna for ear tags is air coil, the surrounding material plastics.

A transponder is a product, which is built by the 3 components microchip with antenna and surrounding material.

2

The Wafer with up to 20.000 microchips

The wafer is the first production step of a transponder

The wafer is sawed and the single chips are packed in trays or on film for on going production depending on the production method

ISO 11784 Silicon or Microchip

1. Laser programed

At the time of the creating of the ISO standard and of the EC regulations there was only laser programed silicon. The ISO 11784 code was already unchangeably programed in the chip on wafer level.

2. OTP (one time programmable)

Today the majority of transponders are made of OTP silicon. The transponder is being built without programming the chip according to ISO 11784. The code shall be programed at any desired time of manufacturing. Each OTP contains a UID.

3. An important point to watch are the silicon clones. (technically identical copies)

4

ISO 24631-1 Conformance Test

1. Annex D – Code of conduct

The ISO 24631 series stands for the tests to be carried out for conformance approval of transponders, readers, synchronisation, displaying the code the ISO 24631-1 stands for the conformance test of transponders and Annex D for the code of conduct.

2. Major points of the Code of Conduct

As the transponders can be programmed today at any time during or after production the uniqueness of the ISO 11784 code is only guaranteed if the manufacturer runs a database which stores the UID of the silicon chip together with the programmed ISO 1174 code.

3. What is a UID?

In the first production step, the wafer, each single silicon chips for the transponder gets a laser programmed, unique serial number, called the UID.

5

Guarantee of the uniqueness only with the UID

11784 Code	UID
972 100000000005	3A24DDC4
233 093400980111	160A9141
233 093400980111	3A24E124
233 096500000011	200E7F5C
900 100000000345	160B6A10
900 000000000008	160B72F2
999 097200000000	3A24D93B
276 274877906943	3A24D8AF
528 219006006006	3A24D86F

Both transponder numbers according to ISO 11784 are identical and vary only with the UID

The UID varies according to the silicon manufacturer, here it is EM

6

Welfare! Wrong animal transponder codes

All problems of the transponder are becoming major problems for the animal and the owner!!!

Problem transponder	11784 code	My commentary
Animal bit = 0	233 098700980111	This is then an industrial code, the reader must clearly show that or does not have to display the code with information like: no animal code
no product code	233 096500000011	The manufacturers 965 as well as 967 have an ICAR manufacturer code and a product code for a 12 mm injectable but no product code for an ear tag
Shared manufacturer code 900	900 072000000345 900 108000000008	This is the correct use of the shared manufacturers codes, according to their ICAR approval it is rather impossible to use the country codes like CH, DK or NL
Wrong Code	804 090010800886	The numbering range of the manufacturer is 900 / 108.000.000.000 - 108.000.999.999 Misuse of the country code and completely wrong coding caused by the lack of a National Authority
Senseless Code	099 090900000000	the country codes 099, 280, 049 and 006 as well as a lot of others are no valid ISO-3166
Senseless Code	280 274877906943	codes, the transponder looks like an ISO-11784 conform code but is not a valid animal code. The coding of the transponders is a proper task of the manufacturer and not of anybody. A country coded transponder needs a reference to the manufacturer
Senseless Code	006 006006000606	
Senseless Code	049 000284161306	

In Tasso registered codes

5 274 143				27600000000314
5 295 103				27600000000318

The country code of Germany is used without any control.

276
The first 2 digits are regulated for Livestock by the Ministry BMELV:
00 = cattle
01 = sheep, goats
02 = horses
Here:

The cattle code structure is used for companion animals and several double codes by the Chinese Manufacturer **WUXI FOFIA**

Antrag
zur kostenlosen Registrierung meines Tieres

TASSO

Bitte in Brückenschlöbchen und mit dunklem Stift ausfüllen!

Angaben zu meinem Tier

Tierart: Hund Katze andern: kastriert sterilisiert

Geschlecht: männlich weiblich

Rufname: **TRAVIS** Rasse: **Südpol-Kurzwärter**

Geburtsjahr: **02.01.2008** Farbe: **rot-schwarz-weiß**

Wsk. Kennzeichen: **BRUNNEN**

Transponder-Nr.: **27600000000300**

Tätowierungs-Nr. (wenn vorhanden):

Tätowierungs-Nr. (wenn vorhanden):

Double transponder number and uncontrolled use of the country code; identification of 2 different animals with the identical transponder code. Responsibility: **The country!!!**

What to do, if a country does not take responsibility?

Responsibilities for a manufacturer

- ICAR certification of the manufacturer – **MC code**
- conformance test for **each** single tag – **ISO 24631-1**
- Signing the Code of Conduct – respecting all ISO rules
- Maintaining an internal database to guarantee each single production step (no Excel list) for the traceability of all manufactured transponder codes! There is no definition how this data base has to look like.
- **Guaranteed** uniqueness of the number
- If using OTP silicon (One Time Programmable) the 11784 code must be stored in a database inseparably together with the UID of the silicon. This is the only way to guarantee uniqueness.

Recommendation to solve the problems of the actual uncontrolled conditions

1. Due to the lack of a National coordinating Authority (so called Competent Authority) wrong codes with the misuse of the country code are brought into the market. The transponder has then an ISO 11784 conform structure, but is not a valid animal transponder.
2. **Mandatory use of Country Codes**
Only the country code offers a Nation to establish guidelines, consequences and penalties as it is not possible to follow a producer in Far East when using the manufacturer code.
3. **Building up the laws (EC 998/2003 is too weak)**
 - Creating a homologation procedure
 - Establishing a contract between National Authority and Manufacturer
 - Education program for the member state countries supported or organised by the EU

National regulation of the country code use for companion animals (UK, CH)

England:

the use of the country code for pets is strictly forbidden by DEFRA, only transponders with manufacturer code are allowed, which does not offer to have a controlled market (Department for Environment, Food and Rural Affairs)

Switzerland:

in the National code the first position is 0 and on the following 3 positions the ICAR manufacturer code, a way which blocks too much numbers for a country

CC = ISO 3166 **7 5 6 0 9 7 2 0 0 0 1 2 3 4**

ISO 14223 – advanced transponders

ISO 14223 – 1: Air Interface

- the way the information will be sent through the air – ready, ISO standard

ISO 14223 – 2: Code and Command Structure

- the structure and the commands how to send information from the reader into the transponder and vice versa – ready, ISO standard

ISO 14223 – 3: Application (not ready yet)

- BIT 15 – RUDI (reference on user data inside)
- Anti-collision – several transponders can be read at the same time
- Sensor data

19

ISO 14223 – reader modes

a) only 11785 mode for mixed population

Animals with 11785 and 14223 in a herd, the reader switches automatically into this mode

b) SAM – short access memory

Defined blocks for storing data at a dedicated position for very quick access and reading to be used in a walk through situation, read ID plus additional block

c) DDM – Data Dictionary memory

Access to the full memory, animal needs to be fixed, capacity of 4Kbyte, 4Kbit data transfer rate = about 8 sec for all memory content

20

Data Dictionary – Object Identifier

- The data dictionary is the summary of all items, which might be written in a transponder with the particularities of all animal species as well as the particularities for all continents. Every item consists of a 5-6-digit code, which stands for the equivalent information to be written into the transponder. This is of high importance for **Health related data** or the **EU - passport**
- No text: i.e. 12345 – stands for rabies vaccine
- The software of the readers knows 12345 and displays the information in the equivalent language

21

100	locked	country code compatible to ISO 3166 and 11875	m	m	m	m	m	m	10 bit	CRC	7

22

The status of the OID Data Dictionary

- The structure and the principal have been worked out in form of a thesis at the Pathology Institute of the Justus-Liebig University in Gießen by a Veterinary
- The work is not finished due to a lack of financing of the Veterinary for the laborious task of completing the **Object Identifier Data Dictionary**
- To be able to use ISO 14223 a full time job for 2 years is needed with a person who understands the subject to complete the **OID DD**
- A workshop with international and political responsible participants is needed to contribute to the **OID DD**
- A budget needs to be available to be able to pay for the work

23

Thank you for your attention
